PATIENT INFORMATION ON

BISPHOSPHONATES

(INTRAVENOUS / IV)

(Examples of brand names: Aclasta, Aredia)

This information sheet has been produced by the
Australian Rheumatology Association to help you
understand the medicine that has been
prescribed for you. It includes important
information about:

• how you should take your medicine
• the possible side effects
• other precautions you should take while
  you are taking bisphosphonates.

Please read it carefully and discuss it with your
doctor.

Important things to remember

• While you are being treated with an
  intravenous bisphosphonate you should
  see your specialist/GP regularly to make
  sure you are getting the most benefit from
  the treatment and to minimise any possible
  side effects.

• If you are concerned about any side effects
  you should contact your specialist/GP as
  soon as possible.

What are bisphosphonates?

Bisphosphonates are medicines used to treat
bone diseases such as osteoporosis and Paget's
disease. Zoledronate (brand name Aclasta) and
pamidronate (brand name Aredia) are the most
commonly prescribed intravenous
bisphosphonates in Australia.

Osteoporosis is a common condition that causes
bones to become fragile and brittle so that they
break (fracture) more easily.

Fractures may be painful and restrict a person's
ability to carry out their normal daily tasks. Using
bisphosphonate in osteoporosis helps reduce the
risk of a fracture happening.

In Paget's disease, the formation of abnormal
bone causes deformity and pain. Bisphosphonate
medicines can help reduce these symptoms.

How do they work?

Bone is constantly changing with old bone being
removed and new bone being formed to take its
place. This usually happens in a balanced way. If
the cycle becomes unbalanced, bone is broken
down faster than it is replaced. This leads to
osteoporosis.

Bisphosphonates are medicines that slow or stop
the bone breaking down. As a result, bone
density may increase over time so the risk of
fracture will reduce.

What benefit can you expect from
your treatment?

Since osteoporosis doesn't usually have any
symptoms such as pain (until a fracture occurs)
you will not ‘feel’ any immediate benefit from your treatment with bisphosphonates.

If used for Paget’s disease, bone pain should lessen with time. Your specialist/GP will explain the likely benefits for you.

You may be asked to have tests to check the effect of treatment on your bones. For example, a bone mineral density test is usually done after one to two years of treatment.

Sometimes tests of urine or blood are also used to measure the effects of treatment on bone formation and breakdown.

### How are IV bisphosphonates given?

Bisphosphonate injections are given as a drip (infusion) into the vein. The infusion will take between 20 minutes and four hours depending on the type of bisphosphonate being given and the condition being treated.

After the infusion, you may have to remain at the clinic for observation for at least an hour in case of side effects.

Bisphosphonate injections may be given once a year or every three months. This depends on which bisphosphonate, what dose and the condition being treated.

Bisphosphonate injections come in different doses. The dose and how often it is given will depend on the type of bisphosphonate being used and the condition being treated.

### Can other medicines be given with bisphosphonate injection?

It is safe to use most other medicines when you are having bisphosphonate infusions (see Precautions on page 3).

Your specialist/GP may suggest that you take paracetamol and an anti-allergy tablet on the day of your infusion.

Your specialist/GP will usually strongly recommended that you take a calcium and vitamin D supplement.

### How long is the treatment continued?

For osteoporosis treatment with intravenous bisphosphonates is usually given for two to five years. Your specialist/GP will review your progress each year. For Paget's disease, the treatment plan may be shorter.

### Are there any side effects?

Most people who have bisphosphonate injections do not experience side effects. Tell your specialist/GP if you are concerned about possible side effects.

A reduction in dose or change to another medicine may minimise the side effects so that you can continue to have treatment for your bones.

### Most common possible side effects

- The most common side effect is a rise in temperature, typically at the start of treatment, with flu-like symptoms such as aching muscles. Rarely the fever may last for one or two days. Giving the medicine slowly and taking regular paracetamol for 24-48 hours reduces the likelihood of this happening.
- Some irritation at the site of injection may occur.
- Intravenous bisphosphonates can cause nausea, loss of appetite and a skin rash. These effects will not last for long.
- Lowered blood calcium levels can occur after the infusion. It is important that your levels are checked before treatment.

### Less common or rare possible side effects

- Bisphosphonates may cause mouth ulcers, aching muscles, joints and/or bones and swelling of joints.
- A very rare side effect with intravenous bisphosphonates is osteonecrosis of the jaw (ONJ). This presents with jaw pain and exposed bone in the mouth. It usually occurs after dental work that has not healed properly. There are few reports of ONJ in patients with osteoporosis. It is usually seen in cancer patients receiving high dose/monthly treatment. For most patients receiving bisphosphonate injections for osteoporosis, the benefits (reducing fracture risk) outweigh the low risk of ONJ. As a precaution, it is recommended that planned dental work (fillings or extractions) be performed before starting bisphosphonate treatment. Also, any dental infections should be treated promptly.
- Blurred vision, pain or redness in the eye (called iritis) may occur and may need to be treated with eye drops. If any of these symptoms occur see your specialist/GP

*Australian Rheumatology Association  
www.rheumatology.org.au  
Revised July 2017*
• An increased frequency of heart palpitations (feeling of fast or irregular heartbeat) has been seen in some patients with zoledronate.

• Worsening kidney function. As a precaution it is advised that patients with severe (stage 4) kidney disease should not receive intravenous bisphosphonates.

• Longterm use of bisphosphonates (over eight years) has been associated with atypical femur fractures. Always tell your specialist/GP about pain in the thigh as this may be a warning signal of such fractures.

What precautions are necessary?

Care of your teeth and mouth

• Before starting bisphosphonate treatment have your teeth checked by your dentist. If surgery (such as extraction) is necessary, this should be done before you start the treatment.

• While having treatment with bisphosphonates you should maintain good oral hygiene (regular brushing and flossing of teeth) and have regular dental checkups.

Blood tests

Kidney function and blood calcium levels should be checked before treatment is started and a baseline kidney function test is also recommended.

Use with other medicines

• You should tell your specialist/GP about all medicines you are taking or plan to take. This includes over the counter or herbal/naturopathic medicines. You should also mention your treatment when you see other health professionals.

• Bisphosphonates should not be taken with other anti-osteoporosis medicines such as denosumab (Prolia), raloxifene (Evista), strontium (Protos) or teriparatide (Forteo).

• The risk of side effects from the low doses of aspirin used to prevent heart attack and strokes is not increased when taken with bisphosphonates.

• The simple pain reliever paracetamol, and combined medicines such as Panadeine and Panadeine Forte, can be used while you are receiving bisphosphonate injections.

Use in pregnancy and breastfeeding

• Bisphosphonates are not recommended to be taken during pregnancy or when breastfeeding. If you are planning a family or become pregnant you should discuss this with your specialist/GP as soon as possible.

Questions?

If you have any questions or concerns write them down and discuss them with your specialist/GP.

Your specialist/GP’s contact details

If you are having IV bisphosphonates you should see your rheumatologist regularly to make sure the treatment is working and to minimise any possible side effects.

How to help us help you

Sign up to the ARAD project now!

The Australian Rheumatology Association collects information on how well these drugs work and how often they cause problems.

The best way to get this information is from you!
